Conclusions of the findings from Principal - Agent modelling (Waterman and Meier broader framework) (i).

Application of the Waterman Meier framework enabled an understanding and description of the dynamic relationship between central government and organisations in the NHS and may predict when tensions will arise in the future

It should be noted that two organisations moved to position 3 before being disbanded.....NICE moved there in 2013 although recently NICE and NHS England have launched a consultation document on changing NICE's methodology to address cost impact as well as cost effectiveness. So it may well move back to position 7 in the future.

Conclusions of the findings from Principal - Agent modelling (Waterman and Meier broader framework) (ii).

NICE did move back to 7

CQC has remained

New organisations were established - NHS Improvement was set up in April 2008 to drive clinical service improvement, but was merged into NHS Improving Quality in 2013. But from 1 April 2016, NHS Improvement became the operational name for an organisation that brought together: Monitor, NHS Trust Development Authority, Patient Safety (from NHS England), National Reporting and Learning System, Advancing Change Team and Intensive Support Teams. In 2018 it became clear that the organisation, while maintaining its statutory independence, was for practical purposes to be merged with NHS England

A workforce crisis ?

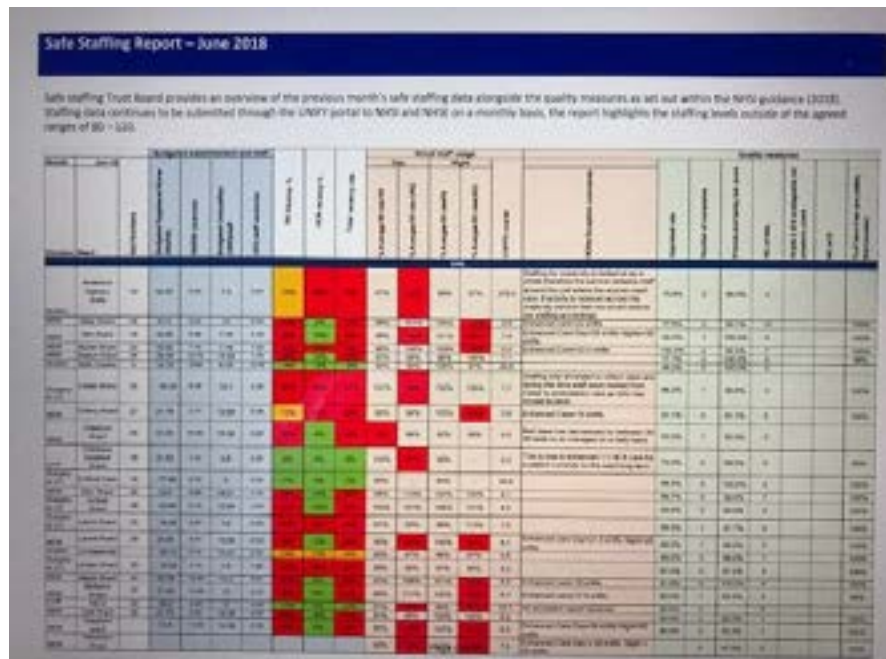

Key points

The census revealed continuing pressure on the medical workforce and the systems in which we work. This pressure is demonstrated by ongoing problems with rota gaps, unfilled posts and high levels of reported sickness absence:

- 45% of advertised consultant posts went unfilled due to a lack of suitable applicants
- 53% of consultants and 68% of trainees said rota gaps occurred frequently or often, with significant patient safety issues in 20% of cases
- Trainees reported that a fellow junior doctor was absent due to sick leave in 46% of their on-call shifts
- Both consultants and trainees estimated that they worked on average 10% more than they were contracted to work
- The number of consultants working less than full time (LTFT) has risen to 23%. This was particularly noted among older consultants who have moved to LTFT, supplementing those working this way on a longer term basis. The number of trainees working LTFT rose to 15%.

NHS staff crisis 'worse than cash woes'

By Nick Triggle
Health correspondent

10 June 2016 Health

The growing crisis in workforce morale is a greater risk to the NHS than the financial problems it is grappling with, a leading health expert says.

Nigel Edwards, chief executive of the Nuffield Trust think tank, warned staff shortages, disputes with government and bullying were creating a "toxic mix".

He said if the problems persisted, the affinity staff felt for the NHS could be irreparably broken.

The warning comes amid growing tensions between the workforce and ministers.

National health and care workforce strategy unveiled

13/12/2017 10:30:00

A system-wide workforce strategy for the NHS and social care launches today for consultation: *Facing the Facts, Shaping the Future, A Health and Care Workforce Strategy for England to 2027*.

The content has been led and coordinated by Health Education England, but is published as a product of the whole national system including NHS England, NHS Improvement and Public Health England.

The draft strategy looks at the major workforce plans for the Five Year Forward View priorities: cancer; mental health; maternity; primary and community care; and urgent and emergency care.

It also contains recommendations for new programmes including the impact of technological advances, examining how training can be improved to make sure that the workforce is being prepared for the future.

Situating Patients and Publics in Sustainability Transformation Plans and Integrated Care Systems: An Integrative Historical Review of PPI in Decision-Making in England's NHS *

Clare Coultas, Katharina Kieslich, Peter Littlejohns

Through an integrative historical review of literature we have situated the particular challenges and opportunities for patient and public involvement (PPI) in decision-making in England's NHS through analyses of its trajectory from before Thatcher through to the present day. We frame these analyses using the concept of 'institutional opportunity structures', and thus detail how the involvement of patients and publics has been conceptualised across the different government administrations and NHS reforms.

Conflict of individual and public health ethics

Liver cancer drug 'too expensive'

A drug that can prolong the lives of patients with advanced liver cancer has been rejected for use in the NHS in England, Wales and Northern Ireland.

The National Institute for Health and Clinical Excellence (NICE) said the cost of Nexavar - about £3,000 a month - was "simply too high".

Professor Peter Littlejohns, clinical and public health director at NICE, said they have to assess the cost-effectiveness of care.

Concern at liver cancer drug decision

A drug that can prolong the lives of patients with advanced liver cancer has been rejected for use in the NHS in England, Wales and Northern Ireland.

The National Institute for Health and Clinical Excellence (NICE) said the cost of Nexavar - about £3,000 a month - was "simply too high".

But Professor Jonathan Waxman, a cancer specialist at the Hammersmith Hospital in London, disagreed with NICE's decision.

Procedural Justice

Provides for 'accountability for reasonableness'. For decision-makers to be 'accountable for their reasonableness,' the processes they use to make their decisions must have four characteristics

Publicity

Both the decisions made about limits on the allocation of resources, and the grounds for reaching them, must be made public.

Relevance

The grounds for reaching decisions must be ones that fair-minded people would agree are relevant in the particular context.

Challenge and revision

There must be opportunities for challenging decisions that are unreasonable, that are reached through improper procedures, or that exceed the proper powers of the decision-maker. There must be mechanisms for resolving disputes; and transparent systems should be available for revising decisions if more evidence becomes available.

Regulation

There should be either voluntary or public regulation of the decision-making process to ensure that it possesses all three of the above characteristics.

Abstract—This article investigates two cases of exploring how, in addition to technical considerations, a factors shape the allocation of health resources. For Thai authorities adjudicated a coverage decision: screening, which meets the national cost-effective only some of the conditions it can detect. For England's Cancer Drugs Fund to investigate the int decision making and political reality. Our find concluding observations for policy makers and -priority-setting processes. First, we observe that diff produce conflicting recommendations, which make very complex. Second, we suggest that robust process and weighing political, ethical, and technical evidence because there is no absolute standard by which a

How can this approach be made useful ?

The question was how to make “a framework “ useful on a day to day basis for policy makers.

As part of an UK National Institute for Health Research (NIHR) funded programme and in collaboration with University College London we have now converted the framework in to a decision support tool

Aims and objectives of NIHR Project in UK

(Collaboration for Leadership in Health Research and Care – CLAHRC South London)

Test and refine the DMAT
with all stakeholders

Assess the role that values
play in decision making in a
national sample of NHS
health institutions – Clinical
Commissioning Groups.

Use the DMAT to assess
whether “accountability for
reasonableness” leads to
more acceptable decisions

Methods

Comparative case studies of 12 South-London clinical commissioning groups (CCGs), responsible for making decisions on health service commissioning, and how to prioritise at local levels.

Governance and policy documents along with stakeholder interviews (e.g. CCG decision-makers, public/patient representatives, and Healthwatch) were analysed using the DMAT (Kieslich and Littlejohns 2015), based on a social values framework (Clark and Weale 2012)

NHS group proposes non-vital operations ban

8 August 2016

f o t e Share

Results (i)

The most prevalent themes arising from the CCG documents were patient and public participation, transparency, and quality of care, and therefore a mix of process and content values.

These themes also featured prominently in the interviews, yet in a much more contested way.

Results (ii)

The politics of transparency, participation, and quality of care were a common point of discussion, seen to be only exacerbating with the continued financial pressures and current health care reforms.

Furthermore, the interviews highlighted how within the CCGs, confusion and different interpretations exist about the different roles of different actors, their statutory mandates and the ultimate goal towards which the NHS is steering.

The Decision making Audit Tool (DMAT)

The new online version of the DMAT priorities4health.com developed in conjunction with “Uscreates”

It was launched at the London CLAHRC Research information meeting at the House of Lords in July 2017.

The DMAT has been tested in England (see other talk) New Zealand and Chile – plans for further testing in Australia, Sierre Leone, Thailand and Brazil

<https://www.uscreates.com/>

Some of the members of the three London CLAHRCs who attended

More than 100 policymakers, clinicians, researchers, representatives from charities, and patients and service users gathered on Tuesday morning this week at the House of Lords to celebrate the important applied health research being undertaken across London.

Decision Making Audit Tool

Welcome to this prototype Decision-Making Audit Tool (DMAT) for priorities in health.

The aim of DMAT is to help patients and interested members of the public work alongside decision-makers who make decisions about what health care services to fund (or stop funding) in their respective health systems. It is also designed to demonstrate to the wider public how these decisions have been made. This is particularly important when budgets are tight, and so funders have to prioritise funding some services or treatments over others. The current version of DMAT has been designed for the UK context, but further work is being undertaken to adapt it to other country contexts. We welcome feedback on your experience of using DMAT.

An example of a content domain

6. Cost effectiveness

Cost effectiveness examines the costs of a service or treatment in relation to its benefits in order to assess whether the costs of funding a service can be justified in light of the expected benefits. Cost effective judgements centred on 'value for money' can be controversial. For some, it means that there is a risk that financial considerations could be put before patients' needs. For others, it means that the needs of all patients, rather than a few, are considered and the best possible care for the largest number of patients is secured. Even when sound health economics methods are used to assess cost effectiveness, a decision has to be made on how much benefit is 'enough' benefit to justify costs. Ask the following three questions to help make your decision or judge how well the organisation is doing. There are links between the questions: read them all before answering each one.

6.1 Does the organisation have a system in place to collect and evaluate evidence in order to ensure that what is commissioned is cost effective?

Rockefeller Academic Residency 2018

<https://www.people4health.com/>

ABOUT THE RESEARCH PROGRAMME

In order to create effective and sustainable health systems many countries are introducing ways to prioritise health services which involves making difficult decisions concerning who gets (and who does not get) healthcare interventions. Priority setting requires technical judgements of clinical effectiveness (what works) and cost effectiveness (is it worth the money). But these judgements are embedded in a wider set of social (societal) value judgements that underlie justifiable reasoning about priorities, including fairness, responsiveness to need and nondiscrimination, and obligations of accountability and transparency. Even when these decisions are based on the best available evidence they face legal, political, methodological, philosophical, commercial and ethical challenges. Through international, multidisciplinary, collaborative working we are developing new ways of addressing these concerns. To generate public acceptance of the need for health prioritisation we have developed a novel way of encouraging key stakeholders, including patients and the public, to become involved in the prioritisation process. Through a multidisciplinary collaboration involving a series of international workshops (funded by the Nuffield Trust, the Wellcome Trust and the Brocher Foundation) we have applied ethical and political theory (including accountability for reasonableness) to develop a practical way forward. We have tested this approach in a range of Clinical Commissioning Groups (responsible for commissioning health services) in England using a mixed methods approach. Out of the first workshop emerged a social values framework that consists of content and process values that has been converted into a decision-making audit tool (the DMAT). Working with a design company we have

Cancer survival in Europe 1999–2007 by country and age: results of EUROCARE-5—a population-based study

Roberta De Angelis, Milena Sant, Michel P Coleman, Silvia Francisci, Paolo Baili, Daniela Pierannunzio, Annalisa Trama, Otto Visser, Hermann Brenner, Eva Ardanaz, Magdalena Bielska-Lasota, Gerda Engholm, Alice Nennecke, Sabine Siesling, Franco Berrino, Riccardo Capocaccia, and the EUROCARE-5 Working Group*

Summary

Background Cancer survival is a key measure of the effectiveness of health-care systems. EUROCARE—the largest cooperative study of population-based cancer survival in Europe—has shown persistent differences between countries for cancer survival, although in general, cancer survival is improving. Major changes in cancer diagnosis, treatment, and rehabilitation occurred in the early 2000s. EUROCARE-5 assesses their effect on cancer survival in 29 European countries.

Methods In this retrospective observational study, we analysed data from 107 cancer registries for more than 10 million patients with cancer diagnosed up to 2007 and followed up to 2008. Uniform quality control procedures were applied to all datasets. For patients diagnosed 2000–07, we calculated 5-year relative survival for 46 cancers weighted by age and country. We also calculated country-specific and age-specific survival for ten common cancers, together with survival differences between time periods (for 1999–2001, 2002–04, and 2005–07).

Findings 5-year relative survival generally increased steadily over time for all European regions. The largest increases from 1999–2001 to 2005–07 were for prostate cancer (73.4% [95% CI 72.9–73.9] vs 81.7% [81.3–82.1]), non-Hodgkin lymphoma (53.8% [53.3–54.4] vs 60.4% [60.0–60.9]), and rectal cancer (52.1% [51.6–52.6] vs 57.6% [57.1–58.1]). Survival in eastern Europe was generally low and below the European mean, particularly for cancers with good or intermediate prognosis. Survival was highest for northern, central, and southern Europe. Survival in the UK and Ireland was intermediate for rectal cancer, breast cancer, prostate cancer, skin melanoma, and non-Hodgkin lymphoma, but low for kidney, stomach, ovarian, colon, and lung cancers. Survival for lung cancer in the UK and Ireland was much lower than for other regions for all periods, although results for lung cancer in some regions (central and eastern Europe) might be affected by overestimation. Survival usually decreased with age, although to different degrees depending on region and cancer type.

Interpretation The major advances in cancer management that occurred up to 2007 seem to have resulted in improved survival in Europe. Likely explanations of differences in survival between countries include: differences in stage at diagnosis and accessibility to good care, different diagnostic intensity and screening approaches, and differences in cancer biology. Variations in socioeconomic, lifestyle, and general health between populations might also have a role. Further studies are needed to fully interpret these findings and how to remedy disparities.

Healthcare Access and Quality Index based on mortality from causes amenable to personal health care in 195 countries and territories, 1990–2015: a novel analysis from the Global Burden of Disease Study 2015

Summary

Background National levels of personal health-care access and quality can be approximated by measuring mortality rates from causes that should not be fatal in the presence of effective medical care (ie, amenable mortality). Previous analyses of mortality amenable to health care only focused on high-income countries and faced several methodological challenges. In the present analysis, we use the highly standardised cause of death and risk factor estimates generated through the Global Burden of Diseases, Injuries, and Risk Factors Study (GBD) to improve and expand the quantification of personal health-care access and quality for 195 countries and territories from 1990 to 2015.

Findings Between 1990 and 2015, nearly all countries and territories saw their HAQ Index values improve; nonetheless, the difference between the highest and lowest observed HAQ Index was larger in 2015 than in 1990, ranging from 28·6 to 94·6. Of 195 geographies, 167 had statistically significant increases in HAQ Index levels since 1990, with South Korea, Turkey, Peru, China, and the Maldives recording among the largest gains by 2015. Performance on the HAQ Index and individual causes showed distinct patterns by region and level of development, yet substantial heterogeneities emerged for several causes, including cancers in highest-SDI countries; chronic kidney disease, diabetes, diarrhoeal diseases, and lower respiratory infections among middle-SDI countries; and measles and tetanus among lowest-SDI countries. While the global HAQ Index average rose from 40·7 (95% uncertainty interval, 39·0–42·8) in 1990 to 53·7 (52·2–55·4) in 2015, far less progress occurred in narrowing the gap between observed HAQ Index values and maximum levels achieved; at the global level, the difference between the observed and frontier HAQ Index only decreased from 21·2 in 1990 to 20·1 in 2015. If every country and territory had achieved the highest observed HAQ Index by their corresponding level of SDI, the global average would have been 73·8 in 2015. Several countries, particularly in eastern and western sub-Saharan Africa, reached HAQ Index values similar to or beyond their development levels, whereas others, namely in southern sub-Saharan Africa, the Middle East, and south Asia, lagged behind what geographies of similar development attained between 1990 and 2015.

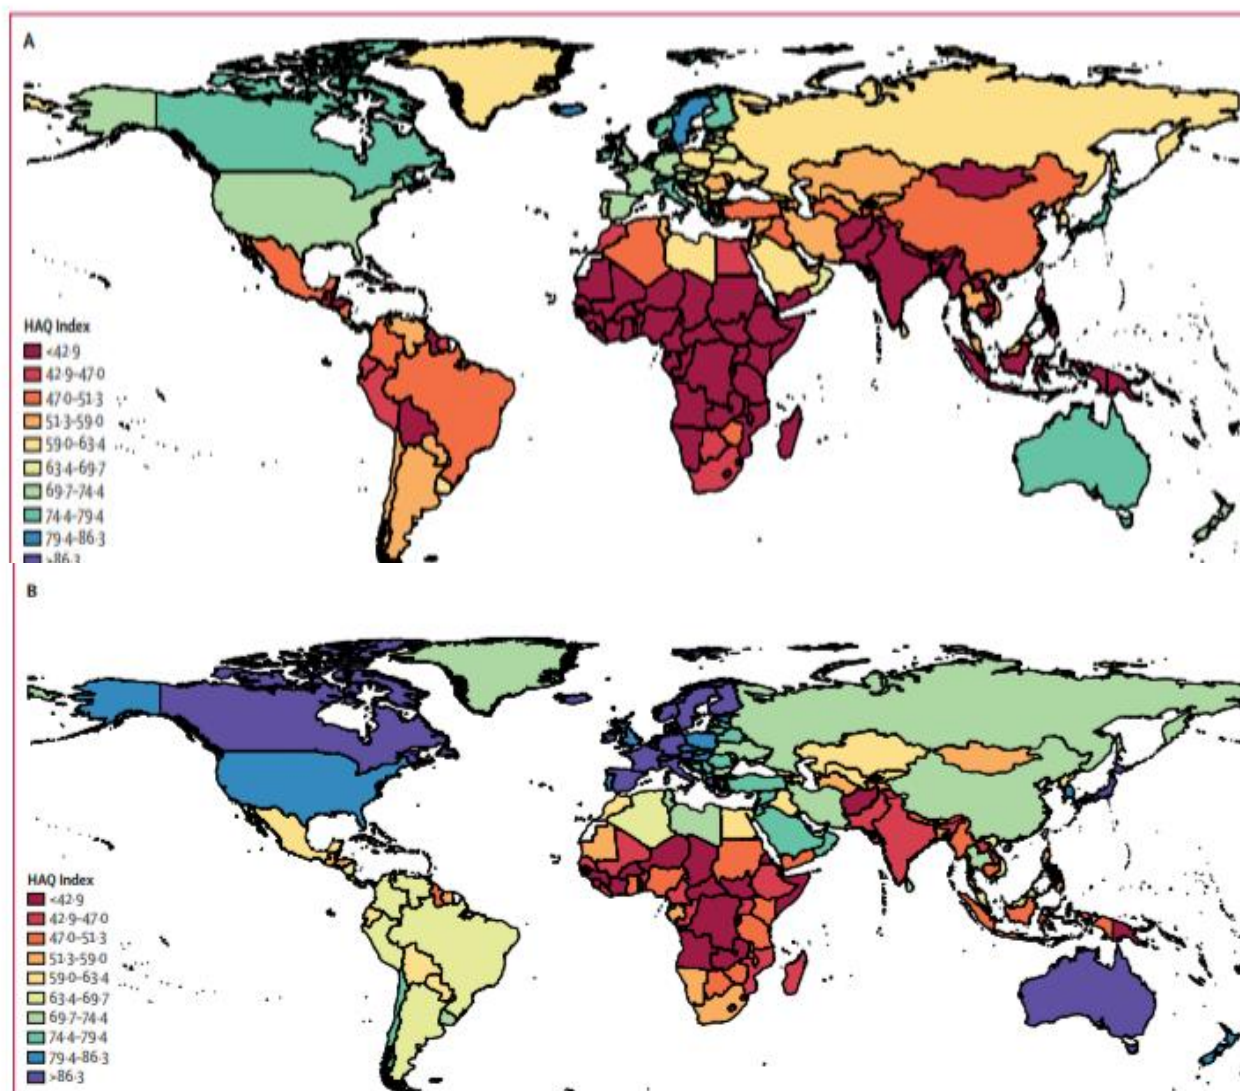

Figure 1: Map of HAQ Index values, by decile, in 1990 (A) and 2015 (B)

Deciles were based on the distribution of HAQ Index values in 2015 and then were applied for 1990. HAQ Index = Healthcare Access and Quality Index. ATG=Antigua and Barbuda. VCT=Saint Vincent and the Grenadines. LCA=Saint Lucia. TTO=Trinidad and Tobago. TLS=Timor-Leste. FSM=Federated States of Micronesia.

Pondering the future

Based on my 40 years experience of the NHS in UK concentrating on the last 20 years. A personal (political science) perspective based on a series of case studies.

Rationing health care: a logical solution to an inconsistent triad
Albert Weale, Professor of Political Theory and Public Policy at
University College London
BMJ 1998;316:410

The basic principle of the NHS is simply that comprehensive, high quality medical care should be available to all citizens on the basis of professionally judged medical need without financial barriers to access. In seeking to enact this principle, the NHS is not alone..... Yet, in the face of increasing healthcare costs this basic principle threatens to become what logicians call an inconsistent triad; a collection of propositions, any two of which are compatible with each another but which, when viewed together in a threesome, form a contradiction.

The Health Service Ideal : High Quality, Comprehensive, Universal

High Quality, Comprehensive, Universal

High Quality, Comprehensive, Universal

High Quality, Comprehensive, Universal

The future

Market forces (purchaser/provider split, commissioning, PFI) have not delivered their promise.

More “connectedness” of local services (health and social care - integrated care systems)

But no clear direction on central versus local balance – how to achieve universality through local entrepreneurship ?

There will always be a need to prioritise health services fairly

The role of evidence is key – but need to be more imaginative on what form it takes

Thank you for listening

Professor Peter Littlejohns
